Learn How To Use Document Fragments 🗑

Create a array that will store all new to do items

Add the value of the input field to the template literal.

Add a data attribute to the template literal that represents the index position of the new to do item in the storage array you created..

Insert the new to do inside the unordered list with the class name ofto-do-container.

Set the value of the input field to an empty string

Add a data attribute to the template literal called category. And randomly pick one of the categories and used it as the value of the data-category attribute.

The categories can be found in the app.data.js file there are 6 categories in the array.
